

Mainboard

Continuity test

Check continuity between points in the two images:

3.3V net (image of bottom side)

Supply 3.3V power to the 3v3 pin and GND pin at the highlighted test points. Verify all boards behave “normally”: no magic smoke, draws nonzero current, does not draw more than ~1A. Components may be warm but should not be hot to touch after running for any amount of time.

A flash drive should appear labeled RPI-RP2, like so:

Test passes if this is the case. The USB-C can be unplugged safely.

Stick Board

Continuity test

Check continuity between points connected in the two images:

3.3V net

GND net

Smoke test

Supply 3.3V power to the V+ pin and the GND pin at the highlighted test points. Verify all boards behave “normally”: no magic smoke, draws nonzero current, does not draw more than 0.3A. Components may be

warm but should not be hot to touch after running for any amount of time.
